# ADJUSTABLE TRANSFORMERS

## GENERAL DESCRIPTION

The adjustable transformers are used for the continuous adjustment of single-phase and three-phase voltages.

They are used in electromechanical and electronic industries, in laboratories and schools.

Principally are used for:

- manual and automatic control of supplies in measurement switchboard
- speed control in rotating machines
- control of heating machines
- educational demonstrations in schools and colleges
- correctly regulate single-phase and three-phase voltages

In respect of thyristor regulators, the AC voltages control by using these adjustable transformers has the following advantages:

- don't cause frequency interferences
- the output voltage wave is perfectly sinusoidal
- high efficiency, low consumption

The adjustable transformers are available in two versions:

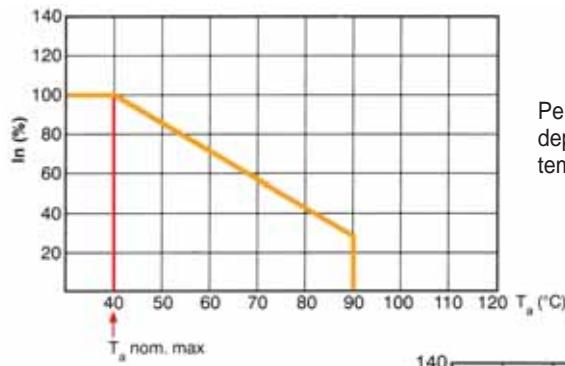

- protected by metallic case , useful for the schools, laboratories, measurement tests
- open execution not protected to be mounted into electrical panels, control switchboards

Excluding the model HST which has the primary separate from the secondary winding, all the models are self-contained transformers.

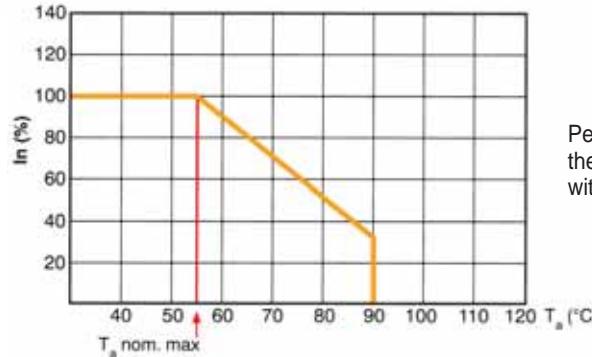

The adjustable transformers are made of high quality materials and manufactured using modern technology, so when the permissible load capacities are observed, no particular maintenance is required. With the standard version the cleaning of the slide surface only is required after long periods of use.

## TECHNICAL CHARACTERISTICS

- The standard versions are supplied by 230V +10% input voltages. This voltage must never be higher than 6% of the nominal value to avoid possible increases of the temperature in the winding over the admitted limit. The secondary circuit conforms to standards VDE 0552/5.69, **must be protected against the short circuits by a fuse or thermic protection. The primary circuit must be protected by a time delayed fuse with proper range.**
- The standard working frequency is 50Hz. Models with frequency at 400Hz can be available on request; it should be understood however that the losses of the core caused by the magnetic hysteresis increases with the increase of the frequency.
- The nominal current load is permitted within the working temperatures from -15°C to +40°C; in case of these limits are exceeded it is necessary to cool the transformer
- Test voltage is 2,5kV at 50Hz from the metallic parts and the points under voltage
- Protection degree: class I
- The protected models in metallic case (HSN and HTN) have the same technical characteristics of the open models; the only difference is in the working temperature that in this case is 30°C. In case of prolonged use (more than 4h continuous use) it is better to reduce the load of about 20% to avoid the overheating of the metallic case.
- In case of their use in presence of high temperatures, the maximum admissible current must be reduced of 15% every 10°C exceedent the max ambient temperature (40°C)

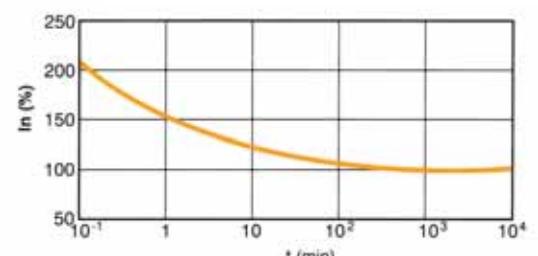

Permissible permanent load , depending by the environmental temperature

Permissible permanent load , depending by the environmental temperature in models with silver circuit

Permissible, depending on the operating time

# SINGLE-PHASE

# VARIABLE RESISTORS

## GENERAL DESCRIPTION

These variable resistors are indispensable aids, designed for varying DC and AC currents and voltages in a wide range of the electric industries, such as testing the electric circuits of motor vehicles, applications in the laboratory, education and others.

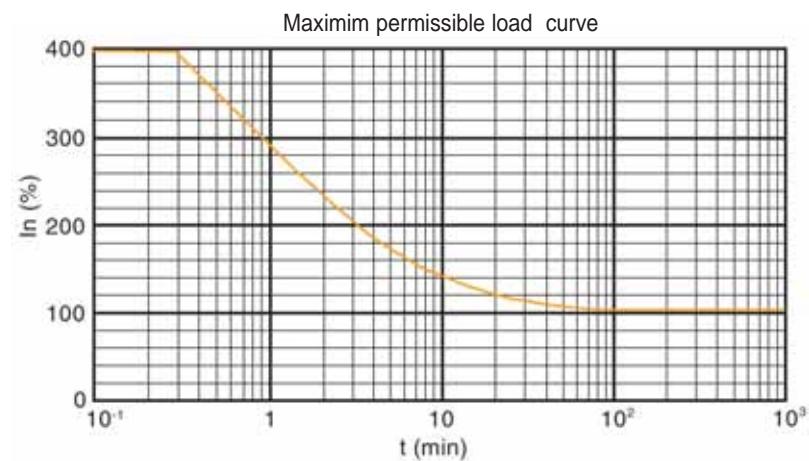

The units can be operated as rheostats or potentiometers.

The principle part of the various types of these variable wirewound resistors are their cores of a pyrostatic ceramic material wound with resistance wire from 1 ohm to 10kohm in compliance with the Renard series. Intermediate values can be provided by connecting the resistance coils of some of the types in parallel.

Non standard values and tolerances can be furnished on special request. Furthermore, bare coil bodies without coils (without casing) can be also supplied.

## TECHNICAL CHARACTERISTICS

- Precision class  $\pm 10\%$
- Insulation resistance:  $> 5M\Omega$
- Earthing resistance:  $< 0,1\Omega$
- Allowed voltage at terminals: max 800V / 750V rms
- Insulation voltage against casing:  $> 1,5$  kV
- Insulation: Class B
- Protection degree: IP20
- Standards: DIN 41480-SE6 / DIN 40050 / VDE 0110

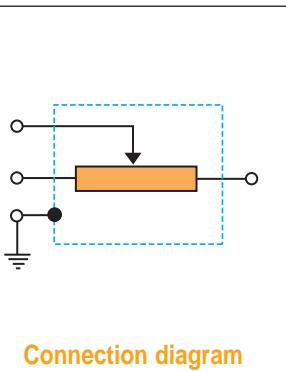

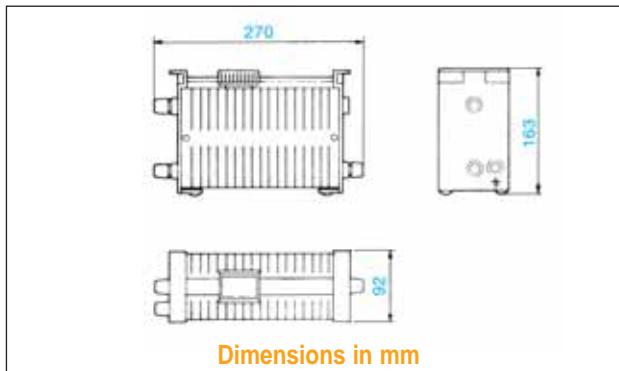

## SINGLE-PHASE

### 7PRN162

- Power 160W
- Weight: from 1,8 to 2,1 Kg depending on the resistive value

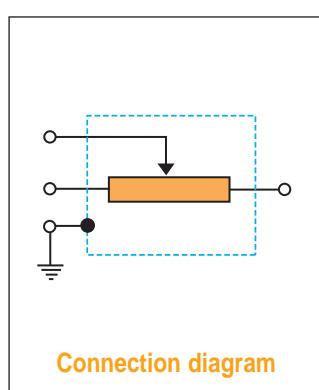

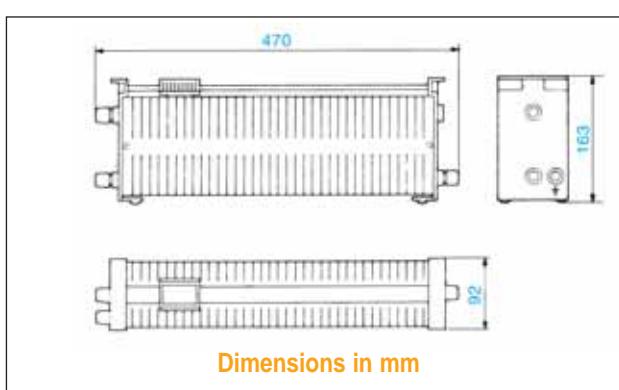

Resistive value ( $\Omega$ )	Max admissible load (A) continuous	15 min
1	13	18
3,3	7	10
10	4	5,7
33	2,2	3,1
100	1,25	1,8
330	0,7	1,0
1000	0,4	0,57
3300	0,22	0,31

### 7PRN322

- Power 320W
- Weight: from 3,3 to 3,9 Kg depending on the resistive value

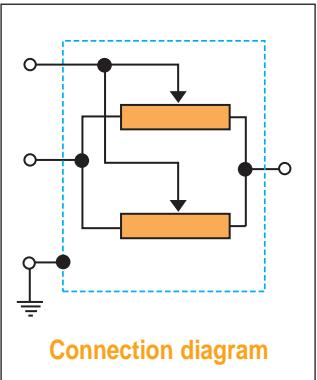

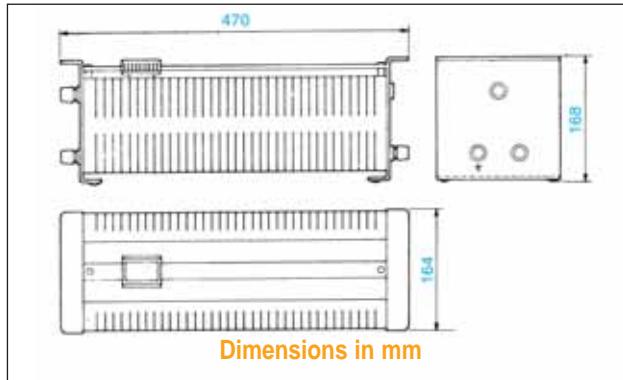

Resistive value ( $\Omega$ )	Max admissible load (A) continuous	15 min
1	18	25
3,3	10	14
10	5,7	8
33	3,1	4,4
100	1,8	2,5

1650	0,6	0,9
5000	0,36	0,5

**Power 960W**

**Weight:** from 8,2 to 10 Kg depending on the resistive value

Resistive value (Ω)	Max admissible load (A) continuous	15 min
0,33	54	76
1,1	30	42
3,33	17	24
11	9,3	13
33	5,4	7,6
110	3	4,2
333	1,7	2,4
1100	0,98	1,4
3330	0,54	0,61

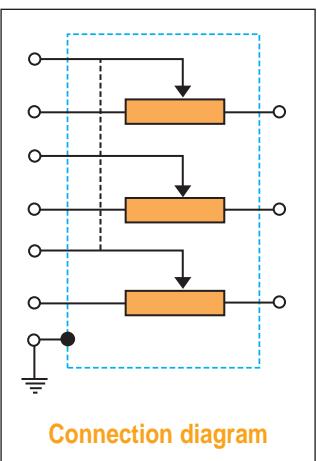

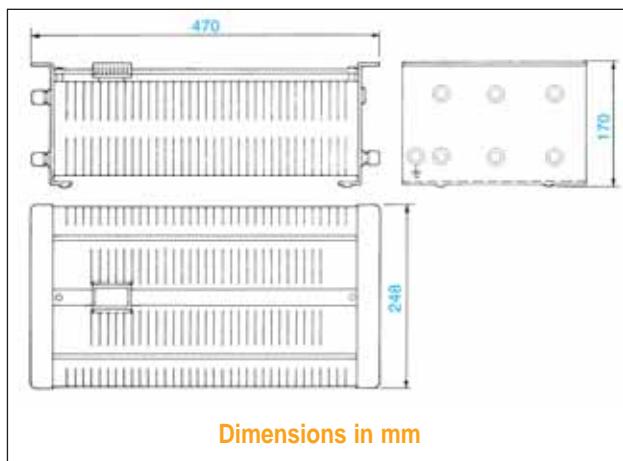

## THREE-PHASE

**Power 3x320W**

**Weight:** from 8,2 to 10 Kg depending on the resistive value

Resistive value (Ω)	Max admissible load (A) continuous	15 min
3x1	3x18	3x25
3x3,3	3x10	3x14
3x10	3x5,7	3x8
3x33	3x3,1	3x4,4
3x100	3x1,8	3x2,5
3x330	3x1,0	3x1,4
3x1000	3x0,57	3x0,8
3x3300	3x0,31	3x0,44
3x10000	3x0,18	3x3,25
